

## Ten frames

### Section 8: Doubling and halving

You can show doubles by building the first number in red and then matching it. A contrasting colour has been used in these examples to show it clearly. Children do not have to use a different resource or colour. Carry on building a single row in the first instance over two frames to double 6, 7, 8, 9 and 10. Halve by arranging the counters as shown and remove one row.

Doubling larger numbers, such as 7 can be shown like this. Build number 7 in both frames and then move some counters from the right hand frame to the left one, completing a ten.
